

ReSource[®] Program

Leadership in Complete Source Management

As a complete radiometric measurement solutions provider, VEGA Americas is committed to supporting total management of ownership. To fulfill this commitment to its customers, VEGA is pleased to offer a responsible method of source life cycle management as an alternative to stockpiling and burial. This method, called the ReSource Program[®], focuses on the reprocessing and reuse of radioactive sources used in industrial measurement systems.

Source Reprocessing and Reuse

Through the ReSource Program and an exclusive brokerage agreement with QSA Global, VEGA Americas can help with the licensed transfer of a source from a customer's site to the manufacturer where it is reprocessed for reuse in a new application.

A proprietary, over-encapsulation process results in a "new" source without harvesting new materials. This eliminates any risks associated with stockpiling and burial, and the old capsule's serial number is eliminated and untraceable to the original owner.

An Ideal Solution

The ReSource Program is the ideal solution for any customer in need of removing unwanted sources with any of the following requirements:

- Eliminate customer liability associated with stockpiling
- Remove multiple source types from multiple manufacturers
- Benefit from complete source life cycle support
- Contact a single supplier for all instrumentation and radiation program needs
- Reduce the impact of radioactive waste on the environment

ReSource Program Benefits:

Relief of Liability

After the source has served its purpose, VEGA Americas can facilitate the licensed transfer and change in ownership and responsibility for that source.

Acceptance of Multiple Source Types

The ReSource Program focuses on cesium and cobalt sources from fixed industrial measurement systems originating from VEGA Americas.

Other manufacturer sources are also accepted through our ReSource Program, and inquiries for other isotopes are always welcome.

Source Renewal

VEGA Americas understands the importance of environmental responsibility. Radioactive sources are only used in applications too difficult for other measurement solutions, and these sources must be properly managed throughout their lifecycle. Reusing sources minimizes the amount of radioactive materials being introduced into the environment.

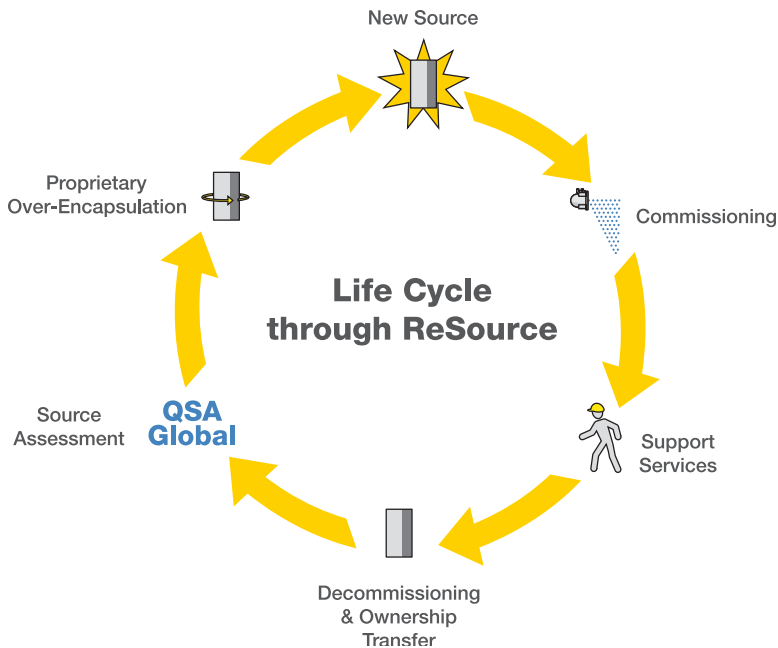

VEGA

Principle of Operation

The ReSource Program assists the customer throughout ownership of a source, supporting complete source life cycle management. From new source procurement through ownership transfer at the end of the source's useful life, VEGA Americas offers full assistance.

The ReSource Life Cycle

The life cycle of a source in the ReSource Program is categorized into six stages.

- **New Source:** A source capsule is sized based on the activity required for its specific measurement application.
- **Commissioning:** The radiometric measurement system is commissioned into service.
- **Support Services:** Field Service provides routine and specialized service for the life of the source.
- **Decommissioning and Ownership Transfer:** Support services decommission the source and initiate the licensed transfer of ownership and responsibility, relieving customer liability.
- **Source Assessment:** Source manufacturer and ReSource partner QSA Global evaluates the source capsule for integrity and activity.
- **Proprietary Over-encapsulation:** QSA Global over-encapsulates the source in an additional capsule using a proprietary process. The source is now ready to be commissioned into a new measurement system.
