Take note of safety instructions for Ex applications

Please note the Ex specific safety information that you can find at <u>www.vega.com</u> and that comes with each instrument. In hazardous areas you should take note of the appropriate regulations, conformity and type approval certificates of the sensors and power supply units. The sensors must only be operated on intrinsically safe circuits. The permissible electrical values are stated in the certificate.

1 Measuring principle

Measuring principle

The devices emit a continuous radar signal through their antennas. The emitted signal is reflected by the medium and received as an echo by the antenna.

The frequency difference between the emitted and received signal is proportional to the distance and depends on the filling height. The determined filling height is converted into a respective output signal and output as measured value.

80 GHz technology

The 80 GHz technology used enables a unique focusing of the radar beam and a wide dynamic range of the radar sensors. The greater the dynamic range of a radar sensor, the wider its application spectrum and the higher its measurement reliability.

Advantages

Non-contact radar technology is characterized by extremely high measurement accuracy. The measurement is influenced neither by fluctuating product features nor by changing process conditions such as temperature, pressure or strong dust generation. The user-friendly adjustment without vessel filling and emptying saves time.

Input variable

The measured variable is the distance between the antenna edge of the sensor and the medium surface. The antenna edge is also the reference plane for the measurement.

3 Instrument selection

Application area

The radar sensors of the VEGAPULS 10, 20, 30 series described here are used for non-contact level measurement of liquids and bulk solids. They can be used in both simple and aggressive liquids. The sensors also measure light and heavy bulk solids absolutely reliably, both with strong dust and noise generation and independent of buildup or condensation.

Device overview

VEGAPULS C 11

VEGAPULS C 11 is the ideal sensor for non-contact level measurement in simple applications where a high degree of protection is required. It is particularly suitable for use in water treatment, pumping stations, rain overflow basins and level monitoring.

VEGAPULS C 21, C 22, C 23

VEGAPULS C 21, C 22, C 23 are the ideal sensors for non-contact level measurement in simple applications where a high degree of protection is required. They are particularly suitable for use in water treatment, pumping stations and rain overflow basins, for flow measurement in open channels and level monitoring.

VEGAPULS 11, 21, 31

VEGAPULS 11, 21, 31 are the ideal sensors for non-contact level measurement in simple applications. They are particularly suitable for use in water treatment, storage tanks with acids, lyes and additives in all industrial areas, or for measuring levels in plastic tanks from the outside through the tank wall.

Configuration and housing protection classes

The radar sensors of series VEGAPULS 10, 20, 30 are available in different designs, housing protection classes and connection techniques. The following illustrations show typical examples.

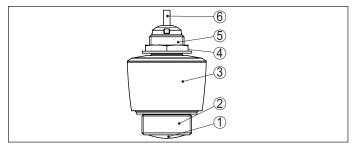

Fig. 2: VEGAPULS C 11 with direct cable outlet in protection rating IP66/IP68 (3 bar)

4 Mounting

Installation position

Mount the sensor in a position which is at least 200 mm (7.874 in) away from the vessel wall. If the sensor is installed in the center of dished or round vessel tops, multiple echoes can arise. However, these can be suppressed by an appropriate adjustment.

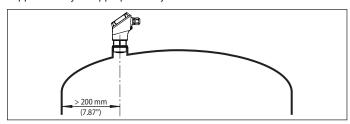

Fig. 6: Mounting of the radar sensor on round vessel tops

In vessels with conical bottom it can be advantageous to mount the sensor in the centre of the vessel, as measurement is then possible down to the bottom.

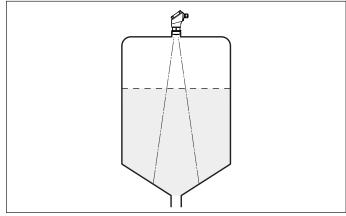

Fig. 7: Mounting of the radar sensor on vessels with conical bottom

Mounting examples gauge measurement

The following illustrations show mounting examples and possible measurement setups.

River level

Radar

Electronics - Two-wire 4 ... 20 mA 5

Voltage supply

Power the instrument via an energy-limited circuit (power max. 100 W) acc. to IEC 61010-1.

Specifications of the voltage supply:

- Operating voltage •
- 12 ... 35 V DC
- Permissible residual ripple
- for U_N 12 V DC (12 V < U_B < 18 V): ≤ 0,7 V_{eff} (16 ... 400 Hz)
 for U_N 24 V DC (18 V < U_B < 35 V): ≤ 1,0 V_{eff} (16 ... 400 Hz)

Keep in mind the following additional factors that influence the operating voltage:

- Lower output voltage of the power supply unit under nominal load • (e.g. with a sensor current of 20.5 mA or 22 mA in case of fault)
- Influence of additional instruments in the circuit (see load values in • chapter " Technical data" of the operating instructions of the respective instrument)

Connection cable

The instrument is connected with standard two-wire cable.

Connection

Direct cable outlet

2	2	Blue	Voltage supply, signal output	-

Connection housing

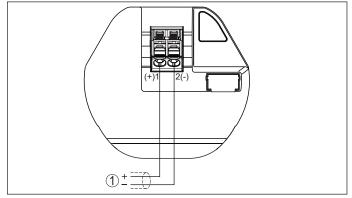

Fig. 13: Connection compartment VEGAPULS

Voltage supply, signal output 1

Electronics - Two-wire 4 ... 20 mA/HART 6

Voltage supply

Power the instrument via an energy-limited circuit (power max. 100 W) acc. to IEC 61010-1.

Specifications of the voltage supply:

- Operating voltage •
- 12 ... 35 V DC
- Permissible residual ripple
- for U_N 12 V DC (12 V < U_B < 18 V): ≤ 0,7 V_{eff} (16 ... 400 Hz)
 for U_N 24 V DC (18 V < U_B < 35 V): ≤ 1,0 V_{eff} (16 ... 400 Hz)

Keep in mind the following additional factors that influence the operating voltage:

- Lower output voltage of the power supply unit under nominal load • (e.g. with a sensor current of 20.5 mA or 22 mA in case of fault)
- Influence of additional instruments in the circuit (see load values in • chapter " Technical data" of the operating instructions of the respective instrument)

Connection cable

The instrument is connected with standard two-wire cable. If electromagnetic interference is expected which is above the test values of EN 61326-1 for industrial areas, shielded cable should be used.

Shielded cable generally necessary in HART multidrop mode.

Connection

Direct cable outlet

Radar

7 Electronics - SDI-12

Voltage supply

The device is supplied with power via an SDI-12 datalogger. Power the instrument via an energy-limited circuit (power max. 100 W) acc. to IEC 61010-1.

Specifications of the voltage supply:

- Operating voltage
- 9 ... 32 V DC
- max. number of sensors
- 32

Connection cable

The instrument is connected with standard three-wire cable without shielding. If electromagnetic interference is expected which is above the test values of EN 61326-1 for industrial areas, shielded cable should be used.

Connection

Direct cable outlet

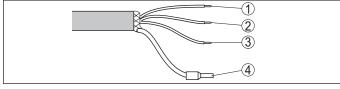

Fig. 16: Wire assignment in permanently connected connection cable

	Wire colour	Function	Polarity
1	Brown	Voltage supply	+
2	Blue	Voltage supply	-
3	White	SDI Data	+
4		Shielding	

8 Electronics - Modbus

Voltage supply

The operating voltage and the digital bus signal are routed via separate two-wire connection cables.

Power the instrument via an energy-limited circuit (power max. 100 W) acc. to IEC 61010-1.

Specifications of the voltage supply:

- Operating voltage
- 8... 30 V DC
- max. number of sensors
- 32

Connection cable

The instrument is connected with standard two-wire, twisted cable suitable for RS 485. If electromagnetic interference is expected which is above the test values of EN 61326 for industrial areas, shielded cable should be used.

Make sure that the entire installation is carried out according to the Fieldbus specification. In particular, make sure that the bus is terminated with suitable terminating resistors.

Connection

Direct cable outlet

2	Blue	Voltage supply	-
3	Black	Modbus signal D0	+
4	White	Modbus signal D1	-
5		Shielding	

Adjustment 9

Wireless adjustment 9.1

Devices with integrated Bluetooth module can be adjusted wirelessly via standard adjustment tools:

- Smartphone/tablet (iOS or Android operating system) •
- PC/notebook (Windows operating system)

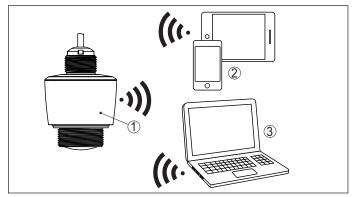

Fig. 18: Wireless connection to standard operating devices with integrated Bluetooth LE

- Sensor 1
- 2 Smartphone/Tablet
- З PC/Notebook

9.2 Adjustment via the signal cable

Devices with signal output 4 ... 20 mA/HART can also be operated via a signal cable. This is done via an interface adapter and a PC/notebook using DTM/PACTware.

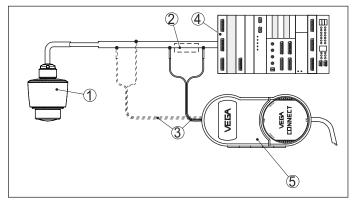

Fig. 19: Connecting the PC to the signal cable

- 1 Sensor
- 2 HART resistance 250 Ω (optional depending on evaluation) Connection cable with 2 mm pins and terminals
- З 4 Voltage supply
- 5 Interface adapter VEGACONNECT

Local adjustment 9.3

The integrated display and adjustment unit is used for on-site adjustment of VEGAPULS 31
